Dear Todd,

I'm writing to apply for the Systems Administrator role supporting your SaaS platform. A small, capable team responsible for platform stability, security, and continuous improvement is exactly the kind of environment where I want to apply what I've spent the past year building independently — real, monitored, production infrastructure, not just theory.

My strongest alignment with this role is around proactive monitoring and automation. I built and currently maintain **SkyOps**, a platform where a background service polls system health every 60 seconds, feeding a live dashboard and a Grafana monitoring stack (request rate, P95 latency, error rate) — the same "catch it before it becomes a problem" mindset your listing describes. I also have hands-on experience with Microsoft Azure, Azure AD/Entra ID, and Microsoft 365 administration, and I write PowerShell and Bash regularly for automation and infrastructure tasks. On the database side, I've designed relational schemas and built environment-based configuration patterns (switching cleanly between development and production databases) across PostgreSQL, MySQL, and SQLite, with backup-and-restore logic built into how I provision infrastructure with Terraform.

I want to be upfront about one gap: my Windows Server administration and SQL Server-specific tuning experience come from coursework and self-directed learning rather than hands-on production work, and my database experience to date has been with PostgreSQL/MySQL rather than SQL Server specifically. What I can offer instead is a demonstrated ability to pick up infrastructure tools quickly and apply them properly — I taught myself Kubernetes, Terraform, and a full CI/CD pipeline from scratch over the past year and have three live systems to show for it, so I'm confident I'd ramp up on your specific stack quickly.

I also bring genuine client-facing communication experience, having led a 5-person team as Project Manager on a capstone project delivered for a real external client — keeping documentation current and communicating clearly with both technical and non-technical stakeholders throughout.

I'd welcome the opportunity to discuss how I could contribute to your team. Thank you for considering my application.

Kind regards,

Priyanshu
