Dear Hiring Manager,

I'm writing to apply for the Software Engineer position at Police HomeCare / Lifestyle Plus. Your focus on building scalable platforms that directly improve comfort and safety for disability and aged care clients is exactly the kind of meaningful, real-world software work I want to be doing — and it's also exactly the kind of work I've already been doing on my own initiative.

I haven't worked as a Software Engineer in a formal employment setting yet, but I've spent the past year building and shipping production software end-to-end — not coursework, not tutorials, but live systems with real infrastructure behind them. Most relevant to this role, I designed and built **TicketDesk**, a Python (FastAPI) REST API backed by PostgreSQL, with a 23-test automated pytest suite, Terraform-provisioned AWS infrastructure, and a GitHub Actions CI pipeline that runs tests and builds a Docker image on every push. It's live today at ticketdesk-app.onrender.com. I also led a 5-person capstone team as Project Manager to deliver **Call-a-Technician**, a full-stack booking platform (Node.js, Express, MongoDB, React, HTML/CSS/JavaScript) that is currently used by a real business client — giving me direct experience gathering requirements from stakeholders, running Agile sprints, and translating feedback into shipped features.

Your essential requirements map closely onto what I've built: strong Python development, web application development with HTML/CSS/JavaScript, relational database experience with PostgreSQL, and the analytical and communication skills needed to work both independently and within a team. On the "highly regarded" side, I have hands-on experience with cloud platforms (AWS EC2, Microsoft Azure), API integrations, and DevOps practices — including a separate project, SkyOps, where I built a complete CI/CD and monitoring pipeline using Docker, Kubernetes, GitHub Actions, Prometheus, and Grafana.

I recognise I don't yet have the two years of professional, post-qualification experience your listing asks for. What I can offer instead is a body of independently delivered, production-grade work that demonstrates I can already do the job — design a system, build it, test it properly, deploy it to the cloud, and keep it running — without needing to be walked through the fundamentals. I'm a fast learner, comfortable picking up new tools and codebases quickly, and genuinely motivated by the idea of contributing to software that supports people's health and independence.

I'd welcome the opportunity to discuss how my project experience translates to your team's needs. Thank you for considering my application — I've included links to my live projects and GitHub throughout this letter and my resume so you can see the work directly rather than just read about it.

Kind regards,

Priyanshu
